

New Chiropractic Treatment for BPPV

Benign Paroxysmal Positional Vertigo-BPPV- is a dizziness that comes on suddenly and is very difficult to get rid of. Also called "Canalithiasis," BPPV occurs when crystals form in the ear canals and cause severe dizziness, especially when the head is held in certain positions.

Dr. Miller recently attended a continuing education seminar to learn a new test and treatment for BPPV. While successful treatment can often take 1 to 6 sessions, Dr. Miller's first patient treated for BPPV with this new technique required only one session. It is a promising development for what was thought to be a hopeless condition. So if you or someone you know has experienced sudden-onset dizziness, call Dr. Miller to schedule this easy evaluation to determine if it's BPPV and determine if this promising treatment is for you.
